

1. What are microservices?

Micro services means a big application is broken down into smaller smaller modules and they are interconnected with each other with the help of web services.

Main benefit of micro service based architecture is they can be deployed individually and different teams can easily work with different modules where teams are not dependent on each other, Because of independency if one module got crashed then it will not effects the other services.

Also we can use different technology for different modules easily.

2. What is API gateway?
3. What is fault tollerance?
4. Eureka Server?
5. ZullServer?
